Sequence 268, Application US/09404879A

Patent No. 6468546

GENERAL INRORMATION:
APPLICANT: Mitcham, Jennifer L.
APPLICANT: King, Gordon E.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND
TITLE OF INVENTION: DIAGNOSIS OF OVARIAN CANCER
FILE REFERENCE: 2.10121-462C2
CURRENT PILING DATE: 1999-09-44

NUMBER OF SEQ ID NOS: 393

This sequence encodes a primatized form of the antibody 7C10 light chain from macaque. This sequence is used in a method which studies new conclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MAD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune cheticiency virus) or inflammatory disease and tumoures. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CD86; inhibitor; immunosuppressant; treatment; autoimmune disease; II-2; T cell/B cell interaction; tumour; inflammation; imaging agent; vaccine; immunogen; anti-idiotype reagent; interleukin-2; IgG; immunoglobulin G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducting the apoptosis of B7+ cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell lymphoma, B cell lymphoma, a getter of the growth and/or metastasis of tumours, B cell specience the growth and/or metastasis of tumours, B call disease, and antipper, multiple sclerosis canaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive airways disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative dother types of allergies e.g. migraine, chinitis and eczema, and other types of allergies. The present nucleic acid sequence encodes the light chain of 7010, a primatised antibody used in the invention to induce apoptosis and inhibit production of

                                 This cDNA encodes a antibody HB4C5 light chain. This antibody light chain or its fragment is specific for carboxypeptidase from bovine or porcine pancreas and is reactive with human cancer tissue. The antibody light chain and its fragment can be used for preparation of a cancer radioimmunoimaging reagent and therapeutic compositions.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                             711

/note="organ: B-cells; vector: ports", site 1: XhoI;
Site_2: EcoRI; cDNA made by oligo-dT priming.
Directionally cloned into EcoRI/XhoI sites using the following 5' adaptor: GGACGAG(G). Size-selected >500bp
for average insert size 1.8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of Galifornia, Berkeley) using ZAP-cDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library."

/note="Organ: ovary (pool of 1); Vector: pCMV-SPORT6; Site 1: EcoRV (destroyed); Site 2: Not1; RNA source pool of three ovaries, from females ranging in age from 38 to 49 yo. Library is oligo-dr primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 2.1 kb, insert size range 1-3.5 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 036."

BG685967 896 bp mRNA linear EST 01-MAY-2001 602638530F1 NIH_MGC_48 Homo sapiens cDNA clone IMAGE:4766335 5', mRNA sequence.
BG685967 GI:13917364
EST.
/note="Organ: pooled pancreas and spleen; Vector:
pCMV-SPORT6; Site_1: Not1; Site_2: EcoRV (destroyed); RNA
source anonymous pool of spleen and pancreas from 28 yo
male. Library is oligo-dT primed and directionally cloned
(EcoRV site is destroyed upon cloning). Average insert
size_1.5 kb, insert size range_1-2.5 kb. Library is
normalized and enriched for full-length clones and was
constructed by C gruber (Invitrogen). Research Genetics
tracking code_025. Note: this is a NIH_MGC Library."

This sequence encodes a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new moncolonal antibodies (MAD 8) that bind selectively to BT.1 (CD80) or to BT.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythemators, specific inflammatory bowel disease, allergy and multiple selectoris, graft vs. Inflammatory bowel disease, allergy and multiple selectoris, graft vs. host diseases. B cell lymphoma infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD on be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small molecule immunosuppressants. Blocking BT/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and inhibits production of interleukin-2 (IL-2), T cell proliferation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360

Human, macaque monkey, light chain, primatised antibody, 16C10 antibody, neuroprotective, apoptosis inducer; allergy, CD28 receptor antagonist, nel pridgen, CD80, B7.2 antigen, CD86, B cell cancer; metastasis, tumour; B cell lymphoma; B cell leukaemia, autoimmune disease; graft-vs-host disease; immunosuppression; organ rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD86) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7.4 cells. The invention is useful for treating diseases such as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopenia purpura, systemic lupus, erythematosus, type 1 diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or
                                                                                                                                                                                                                                                                                                                                                                                         DNA sequence of a primatised form of the light chain of 16C10 antibody.
